

Connect guhaindia.in to Render

Option B: keep the existing GoDaddy website and use a subdomain for the Flask application

Final arrangement

Your existing static website remains at the main domain. The Render application is placed on a separate subdomain.

```
guhaindia.in and www.guhaindia.in -> existing GoDaddy static website
app.guhaindia.in -> Render Flask application
```

1. Add the subdomain in Render

1. Sign in to Render.
2. Open the service running the Flask application.
3. Open **Settings**.
4. Find **Custom Domains**.
5. Click **Add Custom Domain**.
6. Enter exactly:

```
app.guhaindia.in
```

7. Click **Save**. Keep the Render page open because it may display the DNS value to use.

2. Open GoDaddy DNS

1. Sign in to GoDaddy.
2. Open **My Products**.
3. Find the domain **guhaindia.in**.
4. Click **DNS** or **Manage DNS**.
5. Scroll to the DNS records section.

3. Add the Render CNAME record

Click **Add** and enter these values:

Field	Value
Type	CNAME
Name	app
Value	guha.onrender.com
TTL	1 hour

In GoDaddy, enter only `app` in the Name field. GoDaddy automatically adds `.guhaindia.in`.

4. Remove only conflicting records

If an old record already uses the name `app`, delete that old A or CNAME record. Keep only:

```
app.guhaindia.in CNAME guha.onrender.com
```

Do not modify the records named `@` or `www`. Do not delete MX or email-related TXT records. Do not change nameservers.

5. Verify the domain in Render

1. Return to Render.
2. Open **Settings -> Custom Domains**.
3. Find `app.guhaindia.in`.
4. Click **Verify**.

DNS propagation may take a few minutes or, in some cases, several hours. Render automatically provides the HTTPS certificate after verification.

6. Test the application

Open this address in your browser:

```
https://app.guhaindia.in
```

Confirm that the login page appears. Test both admin and staff accounts, then change the default passwords immediately.

Troubleshooting

Domain not verified: check that the record name is `app`, the value is `guha.onrender.com`, and there is no second record named `app`.

Old website disappeared: restore the original GoDaddy records for `@` and `www`; the Render record should only use the name `app`.

HTTPS warning: wait for Render certificate issuance after DNS verification.
